

HARRY PROPERTY

The Harry property hosts gold-rich veins and shear zones and is drained by creeks that contain placer gold and platinum. The property is wholly owned by Strategic Metals. It lies 12 km southeast of the community of Tagish in southwest Yukon, within the traditional territory of the Carcross Tagish First Nation. Access is via helicopter or an ATV trail that extends from the Tagish Road to the property. Most of the property lies below tree line, on the north side of Jubilee Mountain.

The property is situated within Stikinia, an accreted island arc terrane that extends through northern British Columbia into Yukon. The claims are underlain by Carboniferous to Triassic volcanic rocks. A small Mid-Cretaceous plug lies near the centre of the property, and the northeast-trending Crag Lake normal fault is located immediately north of the claims (Figure 2).

Only limited exploration has been done in the area of the property and the work is poorly documented. Prospecting led to the discovery of a gold-rich quartz vein in 1979. Seven hand trenches were dug along the vein and samples from them averaged 9.3 g/t gold, 27.4 g/t silver and 1.0% copper across 1.5 m. Exploration jumped directly from hand trenching to skid-mounted diamond drilling. The best drill result was from Hole J82-5, which returned 1.98 g/t gold, 7.54 g/t silver

and 0.48% copper over 1.8 m.

This interval had 83% core recovery and was described as grey gouge with fractured sulphide-bearing rock. Other vein intercepts had lower core recoveries and weaker gold, silver and copper values.

Strategic staked 16 claims in summer 2015 and soon afterward a two person crew performed one day of prospecting and soil sampling. Four of six rock samples collected from the historical hand trenches returned 5.49 to 31.3 g/t gold. Silver and copper values were also strongly anomalous with peak values of 95.3 g/t silver and 4.72% copper, respectively.

Soil sampling was done at 50 m by 100 m intervals over an 800 m by 400 m area centered on the hand trenches. This sampling returned values up to 391 ppb gold, 4.7 ppm silver and 1500 ppm copper.

Historical hand trench

Following receipt of the rock and soil sampling results, the property was expanded from 16 to 64 claims.

Future work at the Harry property should first include property-wide soil sampling and helicopter-airborne or ground magnetic surveys to trace the known vein and search for evidence of parallel mineralized structures. Geochemical and geophysical anomalies should later be followed up with excavator trenching and/or self-propelled RC or RAB drilling before more diamond drilling is done.
